HKS_67

24 arguments. One practical release.

A structured user-versus-engineering review of the extension, exports, media and optional AI workflow. These are two simulated review perspectives, not two independent agents or a transcript of private reasoning.

Release decision: suitable for controlled desktop use within the tested boundaries. Free local collection/exports remain primary. Do not describe partial coverage, unavailable photos, live paid AI or all-laptop compatibility as solved.

Evidence at a glance

85 grouped automated checks: 13 collector state + 13 media/core + 10 Excel + 14 analysis/API boundary + 25 Chrome integration + 10 Moli DOM checks.

Additional axe audits: zero reported WCAG A/AA violations in setup, review and AI dialog; document-width checks at 320, 640, 780 and 1280 CSS pixels. These are not an accessibility certification.

Historical real dataset: 624 / 639 reported rows, 511 roots + 113 replies, 45 GIF and 80 withheld-photo placeholders. New workbook: four sheets, two native charts and one actually fetched GIF still; validated independently with openpyxl.

No fresh authenticated post collection or real paid API call was made for this release. Chrome/network integration uses deterministic fixtures.

How to read the review

USER VIEW states the practical need. ENGINEERING states a constraint or counterpoint. The decision records the delivered change or an explicit limit, followed by the evidence location. No claim of universal compatibility or complete source access is implied.

01 / Cost

USER VIEW	ENGINEERING
I need the useful work without a premium extension.	Local collection, statistics and every export must remain independent of a paid model.
DECISION / Kept the full local path free; the API is an explicitly optional paid boundary.	
EVIDENCE / README; API consent UI; hks-test.cjs	

02 / Brand and visual identity

USER VIEW	ENGINEERING
The old generic appearance does not feel like my app.	A strong identity should not need a framework, remote font or stock illustration.
DECISION / HKS_67 now has a four-color geometric SVG/PNG identity and a restrained hard-border interface. EVIDENCE / icons/; popup.html/css; real-624-workspace.png	

03 / Landscape readability

USER VIEW	ENGINEERING
I want aligned controls, not a tall pile of tiny buttons.	A Chrome popup has a limited width/height; readable text may require vertical scrolling.
DECISION / Used a 780px landscape shell, compact grouped controls and a wider workspace. No promise of zero vertical scrolling. EVIDENCE / Chrome compact-popup check; 780/1280px UI audit	

04 / Narrow layouts and zoom

USER VIEW	ENGINEERING
It should work on my laptop, even with less space.	CSS layout checks cannot certify every OS zoom, browser policy or screen reader.
DECISION / Verified 320/640/780/1280px document boundaries; disclose that these are not all-device/actual-zoom certification. EVIDENCE / ui-audit.cjs; VALIDATION.md	

05 / One Export dropdown

USER VIEW	ENGINEERING
Too many format buttons make the screen busy.	The dropdown must still work without a pointer and expose its open state.
DECISION / Single collapsed menu with arrow/Home/End navigation, Escape close, focus return and accessible labels. EVIDENCE / chrome-e2e.cjs; popup.js	

06 / CSV row mess

USER VIEW	ENGINEERING
Long URL dumps and multiline cells are hard to scan.	CSV cannot store column widths, colors, pictures or a different hidden hyperlink target.
DECISION / Clean uppercase CSV flattens body whitespace and moves media URLs to Media CSV; original text remains in Detailed CSV/JSON. EVIDENCE / hks-test.cjs; README export matrix	

07 / Username/profile separation

USER VIEW	ENGINEERING
I want the username and profile link in different columns.	Presentation labels must not destroy the actual URL or author data.
DECISION / Separate USERNAME and PROFILE URL; Excel displays a short OPEN PROFILE link while preserving the target. EVIDENCE / 624-row openpyxl validation; analysis.js	

08 / Long numeric IDs

USER VIEW	ENGINEERING
Do not corrupt comment identifiers in Excel.	Quoted CSV alone cannot stop spreadsheet auto-inference or rounding of 19-digit IDs.
DECISION / Workbook IDs are text; CSV documentation instructs text import. No formula-based ID workaround. EVIDENCE / xlsx-test.cjs; actual A2 text-cell check	

09 / Professional Excel

USER VIEW	ENGINEERING
A renamed CSV is not a real Excel deliverable.	OOXML needs valid relationships, styles, tables and charts, not only a .xlsx suffix.
DECISION / Four real worksheets, two native charts, genuine tables, frozen headers, wrapping and color. EVIDENCE / ZIP/CRC tests; independent openpyxl chart/table parsing	

10 / Oversized spreadsheet cells

USER VIEW	ENGINEERING
I still need all the comment content.	Excel has a hard 32,767 UTF-16-unit cell limit, and fixed-height rows cannot show everything at once.
DECISION / Count/label truncation in Coverage; keep JSON lossless and allow the full body through Excel cell/formula-bar inspection. EVIDENCE / Oversized-cell unit test; Coverage sheet	

11 / See available media

USER VIEW	ENGINEERING
A link is not enough when the image could be displayed.	The server may reject a URL, omit it, or return a format the browser cannot decode.
DECISION / Inline image/video previews try returned variants, expose errors and offer explicit retry; no autoplay. EVIDENCE / Chrome 403/fallback/no-loop fixture checks	

12 / Missing photos

USER VIEW	ENGINEERING
Can you repair all 80 missing pictures?	No client can recreate a photo URL that the session never returned without inventing evidence.
DECISION / Preserved all 80 unavailable-photo labels. Did not substitute synthetic pictures or claim recovery. EVIDENCE / Historical archive; media/core tests; sample report	

13 / Photos inside Excel

USER VIEW	ENGINEERING
I want images beside the corresponding row.	Fetching everything can leak requests, hit expiry, inflate files and stall small devices.
DECISION / Opt-in known-CDN downloads: 20 rows, 2 MB/response, 8-second fetch budget/row; PNG stills only. One real returned GIF still is in the sample. EVIDENCE / thumbnails.js; Chrome GIF-to-PNG test; openpyxl image check	

14 / Top-three definitions

USER VIEW	ENGINEERING
Top three likes/comments should be immediately understandable.	Most-liked comments and most-active commenters are different statistics; filtered data changes both.
DECISION / Separate top-three liked comments, commenters by collected rows, and threads by collected replies; label denominator and ties. EVIDENCE / analysis.js; hks-test.cjs	

15 / Charts versus invented insight

USER VIEW	ENGINEERING
I want useful analysis, not decoration or fabricated conclusions.	Local counts do not establish sentiment, intent, demographics or causal explanations.
DECISION / Added content, likes, UTC-time and media charts with methodology; semantic interpretation exists only in the labelled optional AI section. EVIDENCE / Local HTML report; no external analysis requests	

16 / Partial coverage

USER VIEW	ENGINEERING
The platform reports 639; do not quietly call 624 complete.	Reported counters and returned records can differ for reasons a client cannot conclusively identify.
DECISION / Display partial status, 624 saved/639 reported, the difference and reply gaps; preserve original source status on import. EVIDENCE / State tests; real archive; imported partial badge	

17 / Ask ChatGPT automation

USER VIEW	ENGINEERING
I want the whole dataset passed to ChatGPT without tedious work.	Blind website injection/submission is brittle, privacy-sensitive and account/UI dependent.
DECISION / Preview the complete prompt; copy/open or download it; user pastes/reviews/sends. No claim of automatic website submission. EVIDENCE / AI-dialog fixture; full prompt download check	

18 / Optional API convenience

USER VIEW	ENGINEERING
I would rather generate and download the report directly.	A model request can cost money and fail on account access, quota, model or context size.
DECISION / Explicit consent and optional host permission, fixed Responses endpoint, editable model, size/output/time limits and no automatic paid retry. EVIDENCE / Mock provider boundary tests; actual paid account NOT verified	

19 / API-key handling

USER VIEW	ENGINEERING
Do not put my key in a file or saved extension state.	A browser-memory string is transient, not a hardware vault, and cancellation cannot guarantee no provider charge.
DECISION / Key is never persisted/exported; clear on request/close/Escape/pagehide; cancellation is best effort. EVIDENCE / Chrome storage and Escape-clearing test; ai.js/ui.js	

20 / Privacy and anonymization

USER VIEW	ENGINEERING
I want an option not to send names.	Bodies, mentions and context may identify people even after usernames are removed.
DECISION / Username omission is available; raw objects/profile/signed URLs are excluded from the AI pack; wording explicitly says not anonymization. EVIDENCE / Prompt boundary test; exact-payload preview	

21 / Untrusted comments and AI output

USER VIEW	ENGINEERING
Comments or model output must not run code or hijack the report.	Source text can contain HTML and prompt-injection attempts; a model may still produce wrong interpretations.
DECISION / Text nodes/escaping, no executable model HTML, explicit untrusted-data instruction, separately labelled interpretation and evidence. EVIDENCE / HTML script-injection tests; mocked provider-output escaping	

22 / Resume and live errors

USER VIEW	ENGINEERING
A refresh or second tab must not lose hours of collection.	Concurrent writers, quota exhaustion and rate limits require fail-closed behavior, not heroic promises.
DECISION / Retained single-writer lease, per-page checkpoints, headload cursors, pause/resume, quota warning and stop-on-critical-error handling. EVIDENCE / 13 state checks; Chrome refresh/lease/pause/429 fixtures	

23 / Accessibility and corrections

USER VIEW	ENGINEERING
Small print, invisible focus and clipped text are frustrating.	A successful automated audit is narrower than real assistive-technology testing.
DECISION / Increased density fonts, native focus/dialog/menu, full-text disclosure, offline Tamil glyph fallback and reduced-motion rule; fixed the selected-tab hover contrast issue found by axe. EVIDENCE / Zero axe violations in setup/review/dialog; manual SR testing NOT verified	

24 / Maintainability and release claims

USER VIEW	ENGINEERING
I need something that can be updated, not an untested bundle.	Instagram schemas and third-party services change; packaging cannot guarantee every laptop or future version.
DECISION / Separated analysis/Excel/media/AI modules, formatted readable source, schema/architecture docs and reproducible fixtures. Treat live source/API changes as maintenance work. EVIDENCE / 85 grouped checks plus UI audits; historical 624-row validation; README boundaries	

Final corrections and remaining boundaries

Corrected during review: oversized unavailable-media cards; unreachable full comment text; imported-source partial status; selected-tab hover contrast; API-key clearing on Escape; short visible spreadsheet links; stable comment-scoped media references. Native chart and image parts were checked with an independent spreadsheet reader.

Before using live: install/reload on your own desktop browser; export the old JSON before moving installation paths; keep the original post tab open; read the coverage warning; inspect exact AI data before consenting. API account/model/billing and ChatGPT UI behavior still require user-side verification.

Not verified: every laptop/OS, every historic Chrome release, real screen-reader interaction, exhaustive RTL/localization/OS-level zoom, desktop Excel visual rendering, every media codec/URL, provider billing/cancellation behavior, or complete access to inaccessible comments.

Maintenance priority: preserve the proven collector and compatibility keys; keep schema fixtures current; rerun the included tests for changes; never hide uncertainty to make the result look complete.

Source and attribution

Supplied UI guidance: github.com/jakubkrehel/skills, inspected snapshot 592aedc, MIT, Jakub Krehel (2026). Skills were copied into this Arena workspace, not installed into the user’s local editor. See docs/UI-SKILLS.md, VALIDATION.md, ARCHITECTURE.md and the editable docs/review-points.json for implementation and verification details.
